*% detected as AI

AI detection includes the possibility of false positives. Although some text in this submission is likely AI generated, scores below the 20% threshold are not surfaced because they have a higher likelihood of false positives.

Caution: Review required.

It is essential to understand the limitations of AI detection before making decisions about a student's work. We encourage you to learn more about Turnitin's AI detection capabilities before using the tool.

Disclaimer

Our AI writing assessment is designed to help educators identify text that might be prepared by a generative AI tool. Our AI writing assessment may not always be accurate (it may misidentify writing that is likely AI generated as AI generated and AI paraphrased or likely AI generated and AI paraphrased writing as only AI generated) so it should not be used as the sole basis for adverse actions against a student. It takes further scrutiny and human judgment in conjunction with an organization's application of its specific academic policies to determine whether any academic misconduct has occurred.

Frequently Asked Questions

How should I interpret Turnitin's AI writing percentage and false positives?

The percentage shown in the AI writing report is the amount of qualifying text within the submission that Turnitin's AI writing detection model determines was either likely AI-generated text from a large-language model or likely AI-generated text that was likely revised using an AI-paraphrase tool or word spinner.

False positives (incorrectly flagging human-written text as AI-generated) are a possibility in AI models.

AI detection scores under 20%, which we do not surface in new reports, have a higher likelihood of false positives. To reduce the likelihood of misinterpretation, no score or highlights are attributed and are indicated with an asterisk in the report (*%).

The AI writing percentage should not be the sole basis to determine whether misconduct has occurred. The reviewer/instructor should use the percentage as a means to start a formative conversation with their student and/or use it to examine the submitted assignment in accordance with their school's policies.

What does 'qualifying text' mean?

Our model only processes qualifying text in the form of long-form writing. Long-form writing means individual sentences contained in paragraphs that make up a longer piece of written work, such as an essay, a dissertation, or an article, etc. Qualifying text that has been determined to be likely AI-generated will be highlighted in cyan in the submission, and likely AI-generated and then likely AI-paraphrased will be highlighted purple.

Non-qualifying text, such as bullet points, annotated bibliographies, etc., will not be processed and can create disparity between the submission highlights and the percentage shown.

CONCLUSION

Introduction

This chapter reflects on the achievements made during the PSM1 phase for the Al-Muneer Online Portal project and outlines the immediate areas for subsequent development in PSM2. By offering a centralized, user-friendly web-based platform, the project aimed to address the inefficiencies of Al-Muneer Hall's manual inquiry and booking management. Through the establishment of a foundational system design, a comprehensive requirements analysis, a clear methodology, and features like an interactive calendar, dynamic pricing display, online inquiry submission, payment proof upload, feedback mechanism, and administrative controls, the system seeks to offer a modern and effective solution for both the venue owner and potential customers. In addition to discussing the planned development and testing enhancements for the upcoming PSM2 phase, this chapter assesses the progress made in PSM1 towards achieving the original project objectives.

Achievement of Project Objectives

The Al-Muneer Online Portal project's PSM1 phase has effectively established a thorough foundation for future growth. Important objectives pertaining to system design, requirement definition, and project planning have been met. The Waterfall model was chosen as the main system development methodology after a careful examination of Al-Muneer Hall's operational requirements. This provided an organized

project roadmap. Through stakeholder engagement, a thorough set of functional and non-functional requirements was collected and documented, covering all crucial aspects of the proposed portal, including the display of venue information, booking inquiries, management of payment proofs, feedback mechanisms, administrative controls, and reporting. The system architecture has been crafted with a layered approach, and a conceptual database schema was created to effectively manage the portal's data. User interactions and system processes were modeled using use cases, sequence diagrams, and activity diagrams, ensuring clarity in system behavior. This body of work, which includes methodology, detailed requirements, and foundational design, serves as a solid blueprint for the implementation phase in PSM2, positioning the project to successfully achieve its ultimate objectives.

Future Improvements

As the Al-Muneer Online Portal project moves from the planning and design phases of PSM1 into the development-centric PSM2 stage, the upcoming tasks will focus on converting the established designs into a concrete, operational system. The main focus of development will be the comprehensive implementation of the portal utilizing the Spring Boot framework for the backend, along with HTML, CSS, and JavaScript for

the frontend. This encompasses the creation of all outlined modules: user authentication for the admin panel, management of venue information, uploads for the media gallery, an interactive availability calendar, dynamic pricing setup, a booking inquiry system, a straightforward payment proof upload and verification process, a feedback submission and management system, a basic reporting dashboard for the administrator, and a notification system that prioritizes SMS/WhatsApp compatible methods. Thorough unit testing will be conducted simultaneously with the development of each module. After the development of individual modules, system integration will take place, followed by extensive system testing that will cover functional, usability, basic performance, and security dimensions, as outlined in a Software Test Document (STD). The concluding phase of PSM2 will involve deploying the validated application to the specified Cloud VPS environment and finalizing all project documentation and reports. Additionally, further assessment of system performance and the collection of initial user feedback after deployment will be essential to confirm its effectiveness in a practical setting.
