INTRODUCTION

i INTRODUCTION

Al-Muneer Hall for Weddings and Events, owned by Ahmed Almunjid, and located in Ibb, Yemen, currently manages bookings and inquiries mainly through manual phone calls and direct messaging. The Al-Muneer Online Portal tackles this by offering a dedicated web-based platform that consolidates venue information, an interactive availability calendar, pricing, a media gallery, and booking inquiries into one accessible, culturally aware interface for visitors and the hall owner.

? PROBLEM STATEMENT

The owner spends considerable time answering repetitive calls about availability, pricing, and venue details, while booking confirmations and payment tracking remain manual and unstructured. Prospective clients, especially female stakeholders who prefer remote assessment due to local cultural norms, lack a centralized platform to explore the venue and confirm bookings, resulting in delays, inconsistency, and a less professional experience.

INTRODUCTION

PROJECT AIM

The aim of this project is to design, develop, and assess the **Al-Muneer Online Portal**, a **web-based system** that consolidates venue information, streamlines the inquiry and booking confirmation process, and supports the hall owner with feedback collection, reporting, and WhatsApp notifications.

PROJECT OBJECTIVES

- 1 To **elicit and analyze** the functional and non-functional requirements of the portal through direct stakeholder engagement with the hall owner.
- 2 To **design** the system architecture, database schema (ERD), and UI/UX for both visitor and administrator interfaces.
- 3 To **develop and deploy** a functional Spring Boot web application implementing all specified features, hosted on a Cloud VPS.
- 4 To **test and document** the system through black box, white box, and user testing, and prepare documentation for handover.

INTRODUCTION

PROJECT SCOPE

01

Visitors can browse venue information, a media gallery, and an interactive availability calendar showing booked and open dates.

Visitors can view dynamic pricing packages and submit a booking inquiry, optionally uploading proof of payment.

02

03

Each inquiry receives a 9-digit reference code, letting visitors look up their booking status or self-cancel anytime.

Visitors can submit feedback about their experience, which the owner reviews from the admin panel.

04

PROJECT SCOPE

05

The admin manages hall content, media gallery, availability calendar, and pricing through a secure, centralized dashboard.

The admin reviews payment proofs, updates booking status, manages feedback, and sends pre-filled WhatsApp notifications.

06

07

The system is built with Spring Boot (Java) and PostgreSQL, secured with JWT authentication, and deployed on a Cloud VPS.

LITERATURE REVIEW

•CURRENT SYSTEM ANALYSIS

- Al-Muneer Hall's current process relies on phone calls and direct messaging for all customer engagement. Availability, pricing, and booking confirmations are tracked manually, which is time-consuming, inconsistent, and offers no structured way to gather feedback or generate operational insights for the owner.

Comparison Between Existing Systems

FEATURES	Manual Process	Booking Sites	Al-Muneer Portal
Interactive Calendar	No	Often (Complex Setup)	Yes
Payment Proof Upload	(Manual Exchange)	Often Not Direct	Yes (Simple)
Admin Panel	N/A	Yes (Platform Specific)	Custom Built
Feedback System	(Ad-hoc)	Sometimes (Platform)	Yes
Basic Reporting	No	Limited (Platform)	Yes
Cultural Context Adapt	High (Direct Interaction)	Low (Standardized)	High (Custom Design)

METHODOLOGY

03

Waterfall METHODOLOGY

01. Requirements analysis

Requirements were elicited through direct engagement with the hall owner, covering the calendar, pricing, inquiry, payment proof, feedback, and notification features, producing the SRS.

02. System Design

This phase produced the MVC architecture, database ERD, and UI/UX wireframes for both visitor and admin interfaces, documented in the SDD.

03. Implementation (Development)

The system was built with Spring Boot (Java), PostgreSQL, and Thymeleaf. Features were implemented iteratively from v0.3 through v0.7, including the AI advisors.

05. Deployment and Maintenance

The portal was deployed to a Cloud VPS with HTTPS, configured for production use and made accessible to both the hall owner and visitors.

04. Testing and Quality Assurance

Testing combined black box, white box, and user testing with the hall owner, validating booking flows, the payment verification cascade, security, and usability against the SRS and STD.

SOFTWARE & HARDWARE REQUIREMENTS

Software Component	Purpose	Version
Spring Boot (Java)	Backend framework (MVC pattern)	3.4.4 / Java 21
PostgreSQL	Relational database	v16
Thymeleaf	Server-side view templating	Latest
Spring Security (JWT, BCrypt)	Admin authentication & password hashing	Latest
Chart.js	Analytics & report visualisations	Latest
Google GenAI SDK (Gemini)	AI business, feedback & traffic advisors	1.56.0
Maven	Build tool	Latest
IntelliJ IDEA / VS Code	IDE	Latest

Component	Minimum Requirement	Recommended Specification
Processor	Intel Core i5 (dev) / 1 vCPU (VPS)	AMD Ryzen 5+ (dev) / 2 vCPU (VPS)
RAM	8 GB (dev) / 2 GB (VPS)	16 GB (dev) / 4 GB (VPS)
Storage	256 GB SSD (dev) / 20 GB SSD (VPS)	256 GB+ SSD / 50 GB SSD
Operating System	Windows / macOS / Linux (dev)	Linux Ubuntu LTS (VPS)
Network	Standard internet access	Stable broadband + HTTPS/SSL

REQUIREMENT ANALYSIS & DESIGN

03

USE CASE Diagram

DATABASE DESIGN

Database: PostgreSQL, managed via Spring Data JPA:

9 core tables covering venue content, bookings, and operations:

- **AdminUser** — stores admin credentials (BCrypt-hashed) and role
- **VenueInfo & MediaItem** — hall description, FAQ, and gallery images/videos
- **AvailabilitySlot & PricingTier** — calendar dates with status, and pricing packages
- **BookingInquiry** — visitor inquiries with a unique 9-digit reference code
- **PaymentProof** — uploaded receipts linked to an inquiry, with verification status
- **Feedback & NotificationTemplate** — ratings/comments, and admin WhatsApp templates
